Submitted (JAN-2003) to the EMBL/GenBank/DDBJ databases.

-!-CATALYTIC ACTIVITY: ATP + ubiquitin + protein lysine = AMP +

diphosphate + protein N-ubiquityllysine.

-!- PATHWAY: Ubiquitin conjugation; second step.

-!- SIMILARITY: Belongs to the ubiquitin-conjugating enzyme family.

-!- CATALYTIC ACTIVITY: ATP + ubiquitin + protein lysine = AMP +
diphosphate + protein N-ubiquityllysine.
-!- PATHWAY: Ubiquitin conjugation; second step.
-!- SIMILARITY: Belongs to the ubiquitin-conjugating enzyme family.

RT ranscriptomic, and proteomic analyses.",
Science 307:82-86(2005).
C.-I-CAUTION: The sequence shown here is derived from an
EMBL/Gensank/DDBJ whole genome shotgun (WGS) entry which is
prelimiary data.
C.-I-CATALYTIC ACTIVITY: ATP + ubiquitin + protein lysine = AMP +
diphosphate + protein N-ubiquityllysine.
C.-I-PATHWAY: Ubiquitin conjugation; second step.
C.-I-SIMILARITY: Balongs to the ubiquitin-conjugating enzyme family.

"Complete genome structure of Gloeobacter violaceus PCC 7421, a Cyanobacterium that lacks thylakoids.";
DNA Res. 10:137-145(2003).
-!- CATALYTIC ACTIVITY: L-glutamate 1-semialdehyde + NADP(+) + FRNA(Glu) = L-glutamy1-ERNA(Glu) + NADPH.
-!- PATHWAY: Porphyrin biosynthesis.
-!- SIMIARITY: Belongs to the glutamy1-tRNA reductase family.
                                                                                                                                                                                                                                                                                                                                                                    29-MAR-2004 (Rel. 43, Created)

Proc. Components of the ethylene-response pathway identified in a screen for weak ethylene-insensitive mutants in Arabidopsis.";
Proc. Natl. Acad. Sci. U.S.A. 100:2992-2997(2003).
-!- FUNCTION: Probable transcription factor acting as a positive regulator in the ethylene response pathway. Could bind the primary ethylene response element present in the ETHYLENE-RESPONSE-FACTORI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -1- SUBUNIT: Acts as homodimer to bind the primary ethylene response element (By similarity).
-1- SUBCELLULAR LOCATION: Nuclear (By similarity).
-1- MISCELLANBOUS: Loss-of-function mutations (ELL1-1 and ELL1-2) in the gene show a weak ethylene-insensitive phenotype.
-1- SIMILARITY: Belongs to the EIN3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pfam, PF04873; EIN3; 1.

3B9 was positive. CDNA clones of the 3B9 light and heavy chains were cloned into pGEMYf+ and transformed into E. coli DH5-alpha. A heavy chain cDNA clone was sequenced (AAQ83491) that encoded the protein given in AARN0190. 3 CDNB (AAR70198-200) were identified. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a complementarity determining region antibody 399. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin B-mediated allergic reactions e.g. allergic rendiated conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans

The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic demantitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such as euch are useful in the treatment of autoimmune diseases and graft

                                                                                                                                                                                                The present sequence is that of complementarity determining region (CDR) antibodies of the heavy chain of murine monoclonal antibody 10D5. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, and to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            amyloid; antibody engineering; antibody production; allergy; anyloid-associated disorder; Alzheimers disease; cancer; allergy; autoimmune disease; Parkinsons disease; acquired immune deficiency syndrome; multiple sclerosis; migraine; dementia; infection; nootropic; neuroprotective; cytostatic; antiallergic; Immunosuppressive; antiparkinsonian; antimigraine; antimicrobial; anti-HVV; heavy chain; complementarity determining region.

The invention relates to at least one isolated mammalian amyloid antibody comprising at least one wariable region comprising at least one heavy compared to the search of an amyloid polypeptide as an antibody comprising at least one easy chain or light chain complementarity determining at least one heavy can easy chain or light chain complementarity determining at least one believed the amino acid sequence of at least one of SEO ID NO: 73-78, (ii) having the amino acid sequence of at least one of SEO ID NO: 73-78, (iii) having the amino acids 2-7, 3-8, 33-42, or 34-40 of a fully defined sequence of 42 amino acids (SEO ID NO: 50), (iii) an isolated nucleic acid encoding at least one of any of the isolated mammalian amyloid antibody. (iii) an isolated nucleic acid encoding at least one of any of the isolated mucleic acid encoding an environment of SEO ID NO: 51, 52, 61, 62, 71, 72, 81 and 82, (iv) an isolated nucleic acid encoding an amyloid antibody, (vi) a protatypotic or entarpotic host cell comprising an isolated nucleic acid encoding an amyloid antibody, (vi) a method of producing at least one manyloid antibody or fragment that specifically binds at least one of the amyloid antibodies mentioned, and at least one pharmaceutical carrier or anyloid antibodies mentioned, where the seplated condition in a cell, tissue, organ or animal, (x) a medical device comprising a contracting or administering a composition comprising at least one of the amyloid antibodies mentioned, where the device comprising a contracting or administering as composition comprising contracting or administering as mayloid antibodies mentioned, where the device comprising a contracting or administering as contracting or administering as contracting or administering as contracting or administering as anyloid antibodies mentioned, where the device comprising a contracting or administering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       migraine, dementia and infections. This sequence represents a heavy chain CDR useful in the antibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    autoimmune disease, Parkinson's disease, AIDS, multiple sclerosis, migraine, dementia and infantian

                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin atopic dermaities, caractions estimated allergic rehinitis, conjunctivitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans. The present sequence represents the heavy chain variable region of Ig NEW, and is used in the course of the

This sequence represents the heavy chain of the humanised 189 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic asthma and anaphylactic shock. The antibodies are also useful for requlating B and T cell proliferation and as such are useful in the treatment of autolimune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse; 1F7; antibody; immune modulator; anti-HIV antibody; CDR; complementarity determining region; framework-determining region; FR; heavy chain; light chain; HIV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a hepatitis C virus (HCV) vaccine comprising different groups of peptides each group being capable of raising, in an infected individual, an antibody able to bind to the hypervariable 1 (HVR1) region of the envelope protein E2 of the infecting HCV strain. The different groups of peptides are administered sequentially to raise antibodies, helper Tlymphocytes, and cytotoxic Tlymphocytes which are cross-reactive to the HVR1 region of the infecting HCV. The vaccines are useful for preventing and treating chronic HCV
                                                                                                                                                                                                                                                                                                    The present invention relates to coding sequences of the murine 1F7 antidictypic antibody complementarity-determining region (CDR) or framework-determining region (FR). The antibody binds to human or primate antihuman immunodeficiency virus (RIV) antibodies and can be used in the treatment of HIV infection. The present sequence is the 1F7 heavy chain
                                                                                                      New polynucleotide encoding a complementarity- or framework-determining region of an anti-idiotypic antibody that binds to human or primate antihuman immunodeficiency virus (HIV) antibodies, for use in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention describes an isolated antibody that binds specifically to a stalk of CD30 of a cell, or to an epitope destroyed upon cleavage of soluble CD30 (sCD30) from intect CD30. Also described:

(1) a composition comprising the acid encoding an antibody that binds therapeutic part; (2) a nucleic acid encoding an antibody that binds composition comprising the acid encoding an antibody that binds specifically to a stalk of CD30 of a cell, or to an epitope destroyed upon cleavage of sCD30 from intact CD30; (3) an expression vector comprising the nucleic acid operably linked to a promoter; (4) inhibiting growth of a CD30+ cancer cell; (5) detecting the presence of a CD30+ call cancer cell; (5) detecting the presence of a CD30+ call cancer cell and antibody having variable heavy and variable light can a biological sample comprising a container and an anti-CD30 antibody has cytostatic activity, and can be used in gene therapy. The anti-CD30 antibody that binds specifically to a stalk of cD30+ cancer cell, or to an epitope destroyed upon cleavage of sCD30 from intact CD30 is useful for the manufacture of a medicament for inhibiting the exemplification of the present invention.
                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antibody that binds specifically to a stalk of CD30 of a cell, or t
an epitope destroyed upon cleavage of soluble CD30 (sCD30) from intact
CD30, useful for inhibiting the growth of a CD30+ cancer cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an engineered CD44 antibody for inducing the differentiation and wither of leukemia cells, the gene in the heavy chain and light chain variable region of monclonal antibody H144a of CD44, the polypeptide coded by said gene, the carrier containing said gene, and polypeptide in preparing medicines for diagnosing and treating leukemia and disclosed. The present sequence represents the amino acid sequence of the mouse CD44 antibody V segment.

```
The present sequence is that of a preferred heavy chain variable region of a humanised antibody of the present invention. In this sequence, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 10D5 and the framework region originates from human continuous and the framework region originates from human continuous demanders. These continuous demanders and Jesquent JH4. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope location) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their fragments, as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology cansociated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical Alzheimer's disease or creduce Abeta plaque in the brain. The present sequence is that of a particularly preferred heavy chain variable region of a humanised antibody of the present invention. In this sequence, the complementarity determining regions originate from murine monoclonal antibody 10D5 and the framework region originates from murine germline VH segment DP-28 and J segment JH4. Novel humanised antibodies CC of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope clocation) approximately the same as those of the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their framents as well as nucleotide sequences, vectors, transformed host cells, and methods of using the humanised antibody to treat, prevent, alleviate, reverse or otherwise ameliorate symptoms and/or pathology associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical amyloid angiopathy, and to inhibit formation or celuce Abeta plaque in the brain. (Updated on 23-OCT-2003 to standardise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New humanized 10D5 antibody, useful for the manufacture of a medicament for treating Down's syndrome, clinical or pre-clinical Alzheimer's disease or cerebral amyloid angiopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present sequence represents the heavy chain variable region of murine interleukin.4 (IL-4) antibody 3B9. The sequences are used in the production chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin B-mediated allergic reactions e.g. allergic rehinitis, conjunctivitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New DNA molecules encoding recombinant antibodies useful for treating IL4-mediated conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Spleen cells from mice immunized with human IL-4 were used to prepare hybridomas, which were screened for anti-IL-4 MAb secretion. Only clone 3B9 was positive. cDNA clones of the 3B9 light and heavy chains were cloned into pGEM7f+ and transformed into B. coli DH5-alpha. The clones were sequenced (AAQ84849-91), and used for antibody engineering. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the heavy chain of the murine 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (1gE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermartisis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                Antibody, interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allargic disorder; allergic kninitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant IL4 antibodies useful for tratment of allergic rhinitis, atopic ashthma and anaphylactic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Humanized antibody; antibody engineering; monoclonal antibody; MAb;

```
A humanized antibody heavy chain variable region and signal sequence is given in AAR70192. The signal sequence is also provided in AAR70193. The CST sequences of the construct are identical to the native CDRs of mouse anti-human IL-4 MAD 3B9 (AAR70198-200). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chimeric and humanised IL-4 monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of IL-4-mediated and IgE-mediated allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric antibody; antibody engineering; monoclonal antibody; MAb;

The present sequence represents the heavy chain variable region of a humanised murine interleukin-4 (IL-4) antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The approximation antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                New DNA molecules encoding recombinant antibodies useful for treating ILA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heavy chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin B-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic aesthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Heavy chain variable region of murine/human chimeric antibody 3B9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2; Length 141;

This sequence represents the light chain of the chimeric 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the heavy chain of the humanised 3B9 antibody of the invention.                                                                                                                                                                                                                                                      ð
                                                                                                                                                                   murine/human interleukin-4 (IL-4) chimeric antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans. The invention is useful for preventing or treating an amyloidogenic disease or Alzheimer's disease in a patient. The invention is also useful for in vivo imaging amyloid deposits in a patient. The present amino acid sequence represents a mouse 3D6/10D5 variable light (VL) chain or variable heavy (VH) chain protein of the invention
                                                                                                                                                                                                                                                                           Mouse; humanized; immunoglobulin; Ig; light chain; LC; heavy chain; HC; variable region complementarity determining region; 3D6; 10D5; variable framework region; amyloidogenic disease; Altzheimer's disease; amyloid deposit; variable light chain; VL; variable heavy chain; VH; nootropic; neuroprotective; inhibitor of beta amyloid accumulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel light/heavy chain of humanized immunoglobulin for treating amyloidogenic disease, has 3D6/10D5 variable region complementarity determining regions and variable framework region from human acceptor

The invention relates to a novel humanised immunoglobulin light or heavy chain. The humanised immunoglobulin light or heavy chain comprises:

variable region complementarity determining regions (CDR's) from the 3D6 immunoglobulin light chain variable region sequence of 132 amino acids fully defined in the specification (ADR88406), or heavy chain variable region sequence of 134 amino acids fully defined in the specification (ADR88408), or region sequence of 134 amino acids fully defined in the specification (ADR88408), or sequence of 131 amino acids given in the specification (ADR88418) or heavy chain variable region sequence of 142 amino acids fully defined in the sequence of 131 amino acids simmunoglobulin light or heavy chain sequence, provided that at least one framework residue is substituted with the corresponding canno acid residue from the mouse 3D6 or 10D5 light or heavy chain a residue that con-covalently binds antigen directly, a residue as a residue that con-covalently binds antigen directly, a residue adjacent to a CDR interacting residue or a residue participating in the VL-VH interface. An antibody of the invention has neuroprofective and nootropic activity, and may have a use in gene therapy. The composition and methods are useful for preventing or treating an amyloidogenic disease, such as three-dimensional image of a 3D6 or 10D5 immunoglobulin, immunoglobulin heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New humanized antibodies that recognize beta amyloid peptides, useful for preventing or treating amyloidogenic diseases, such as Alzheimer's

treating an amyloid antibodies mentioned, (ix) a method of diagnosing or treating an amyloid antibodies mentioned, (ix) a method of diagnosing or treating an amyloid related condition in a cell, tissue, organ or animal, comprising or administering a composition comprising at least one of the antibodies mentioned, with, or to, the cell, tissue, organ or animal, (x) a medical device comprising at least one amyloid antibody (xi) an article of manufacture for human at least one amyloid antibody, (xi) an article of manufacture for human pharmaceutical or diagnostic use, comprising or administering at least one amyloid antibodies mentioned, and (xii) a method of producing at least one of the isolated mammalian amyloid antibodies of the isolated mammalian amyloid antibodies of the isolated mammalian amyloid antibodies, comprising a solution or a lyophilized form of at least one of the amyloid antibodies mentioned, and (xii) a method of producing at least one of the isolated mammalian amyloid antibodies, comprising a providing a host cell or transgenic animal or transgenic plant or plant cell capable of expressing the antibody in recoverable amounts. The methods and compositions of the present invention are useful for producing therapeutic compositions and devices for treating amyloid-autoimmune disease, Parkinson's disease, AlbS, multiple solerosis, autoimmune disease, Parkinson's disease, AlbS, multiple solerosis, migraine, dementia and infections. This sequence represents a heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAQ70612 codes for human interleukin-6 binding inhibitor, the polypeptide described in AAR58612. This polypeptide thibits the binding of human IL-6 to its receptor, and can therefore be useful in the treatment of a variety of autoimmune diseases; specifically in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide inhibiting binding of human interleukin-6 (IL-6) to its receptor - useful for treating auto:immune disease induced or aggravated
anti-idiotype antibody or fragment that specifically binds at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
